Deploy Kafka

Kafka Ecosystem

Packaging Versions:

Confluent Cloud

Cloudera

**Strimzi offers the
Helm charts to
deploy Kafka to
Kubernetes**

In the Logging Area, for Example, We Have Plugin For:

syslog

fluentd

Logstash

Filebeat

DBs

1ST

JDBC connector to cover RDBMS Dbs

2ND

Debezium also offers a connector that include no-SQL Dbs

3RD

Presto connector that allows us to query Kafka using Presto queries

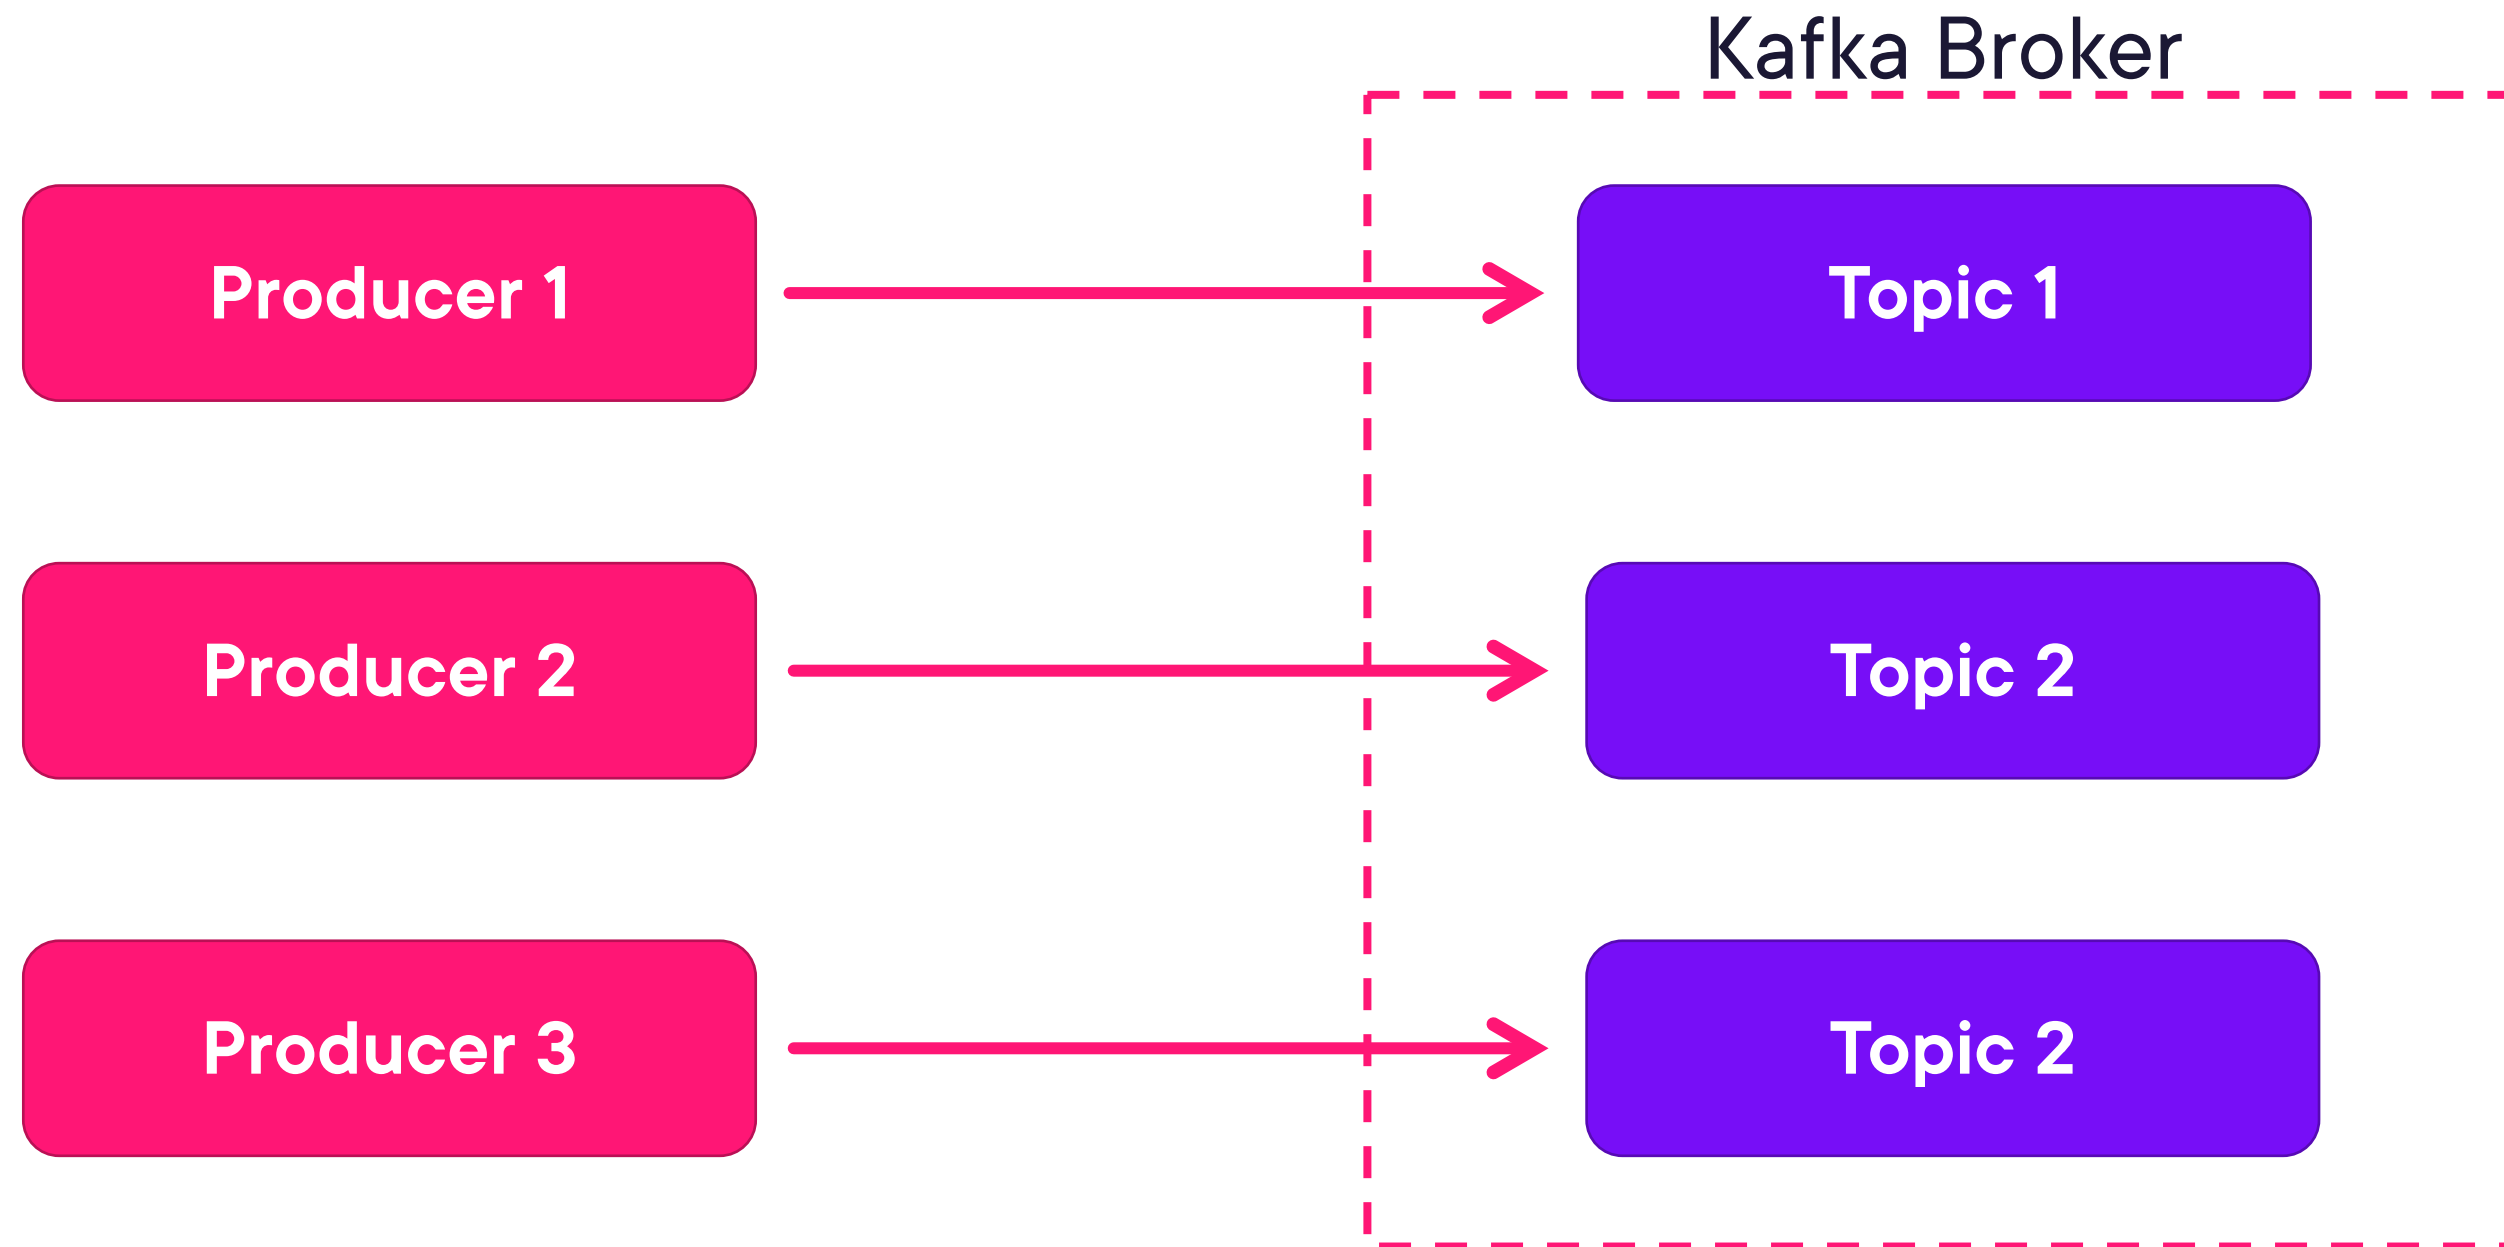

Interaction with Kafka via the CLI

Topics, Partitions, and Rebalance

Topics

Retention Can Be Set To:

Days: Meaning only keeps messages of up to N days and then delete

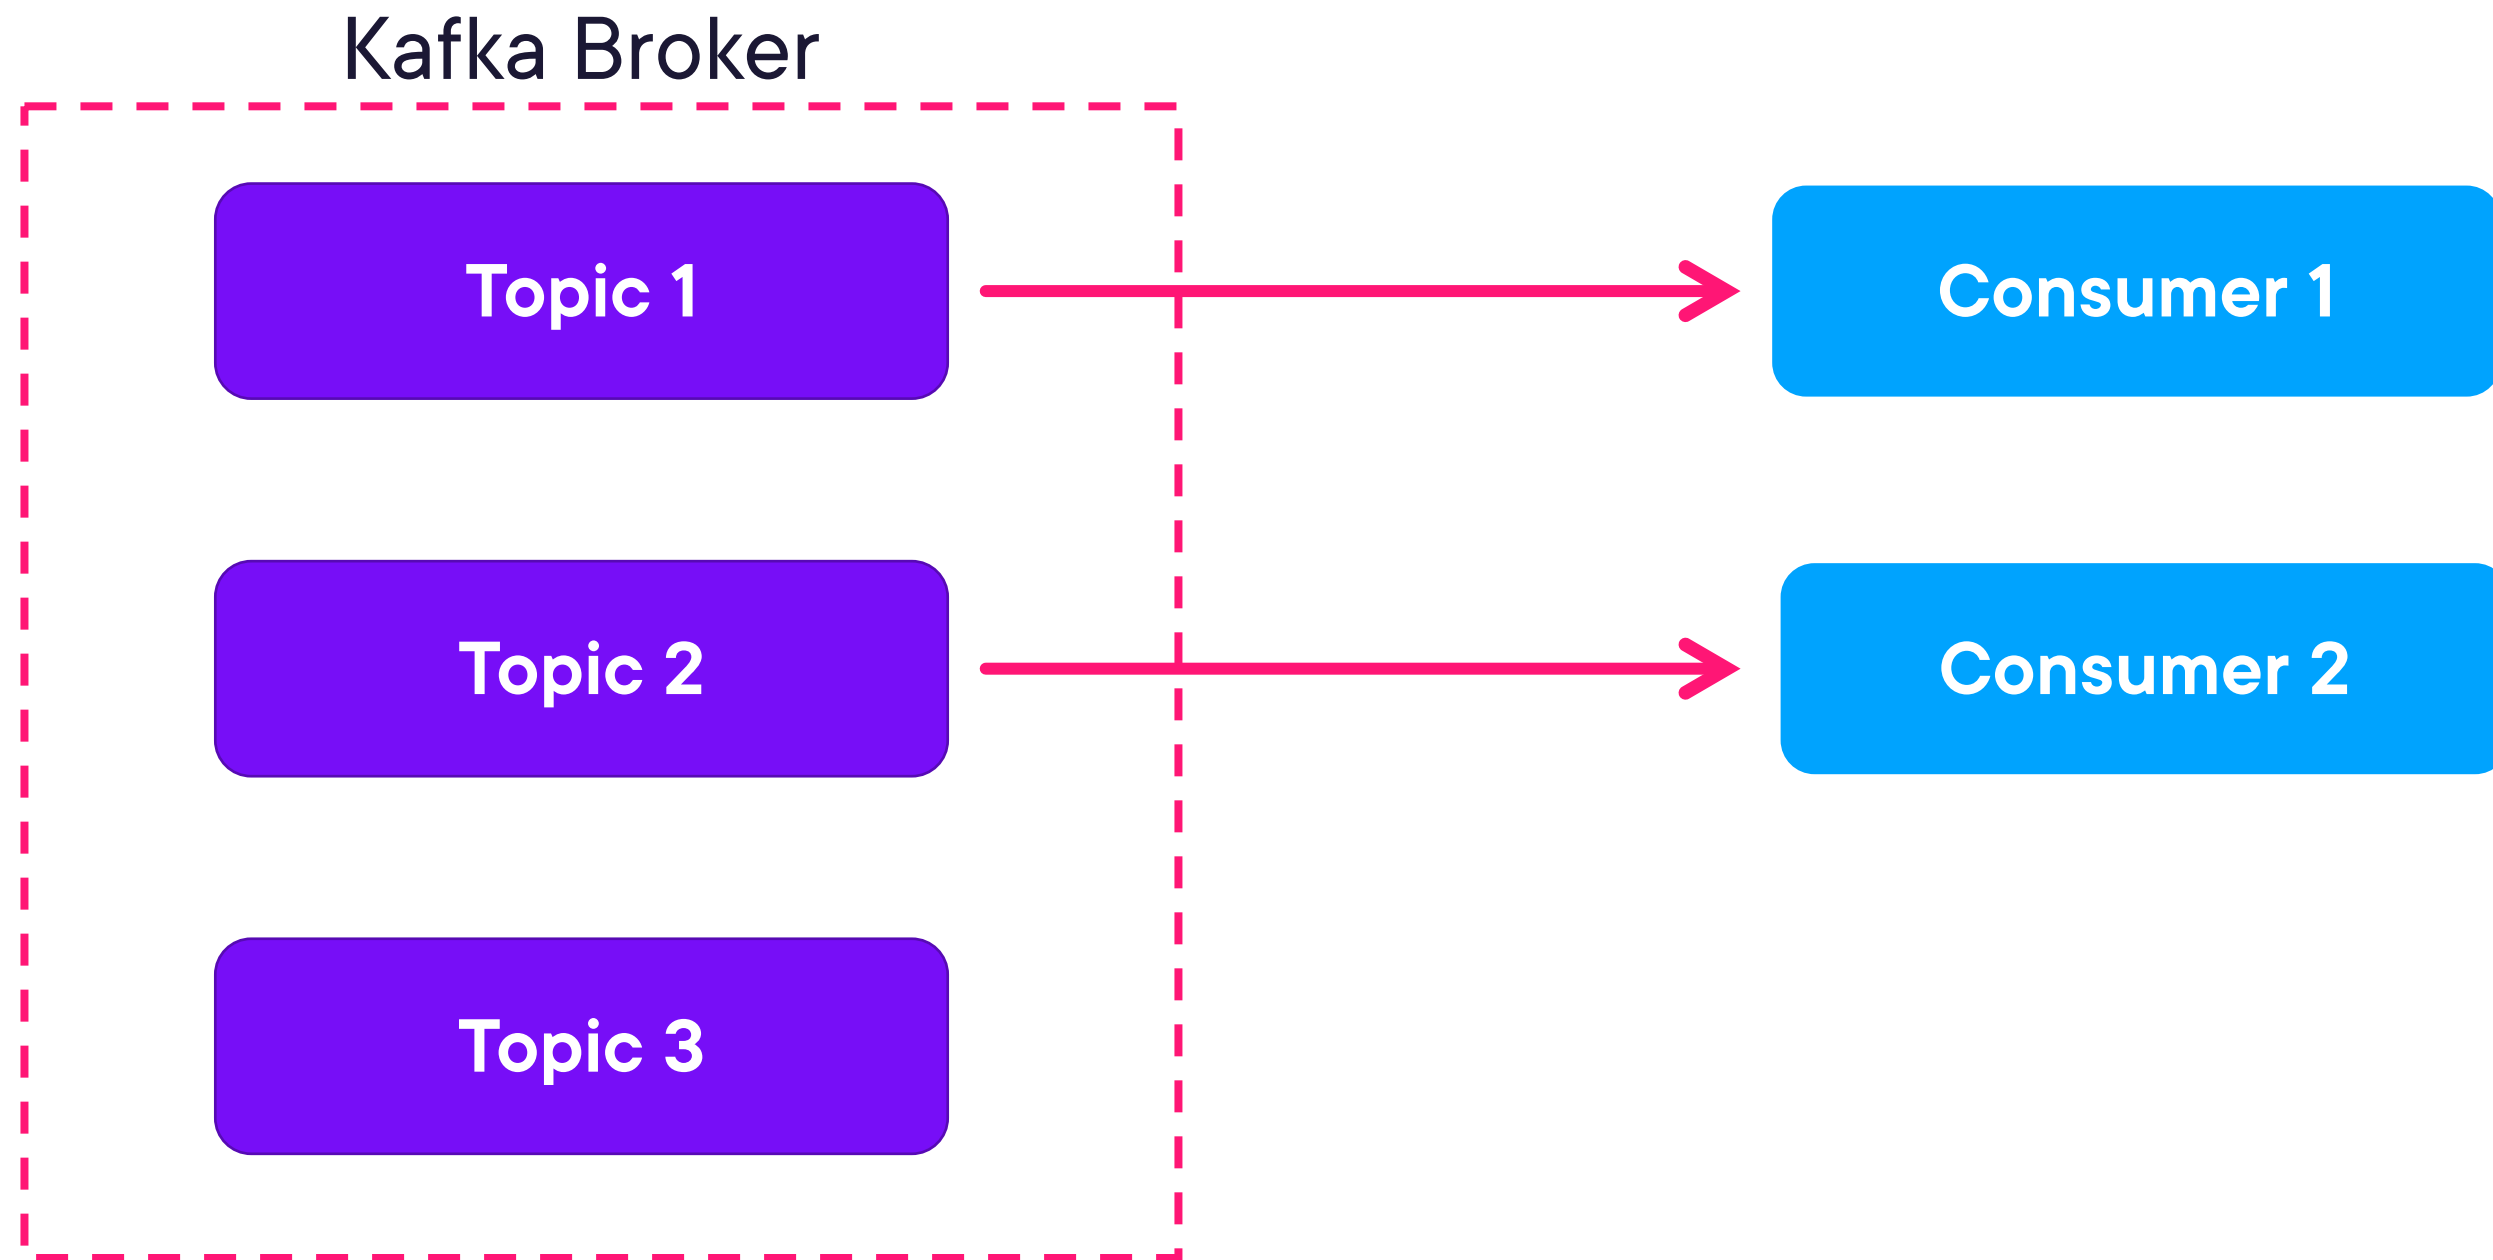

Bytes: Meaning only keep messages until the topic has more than X bytes and then delete

None: Meaning store all messages from the beginning of time

Topics

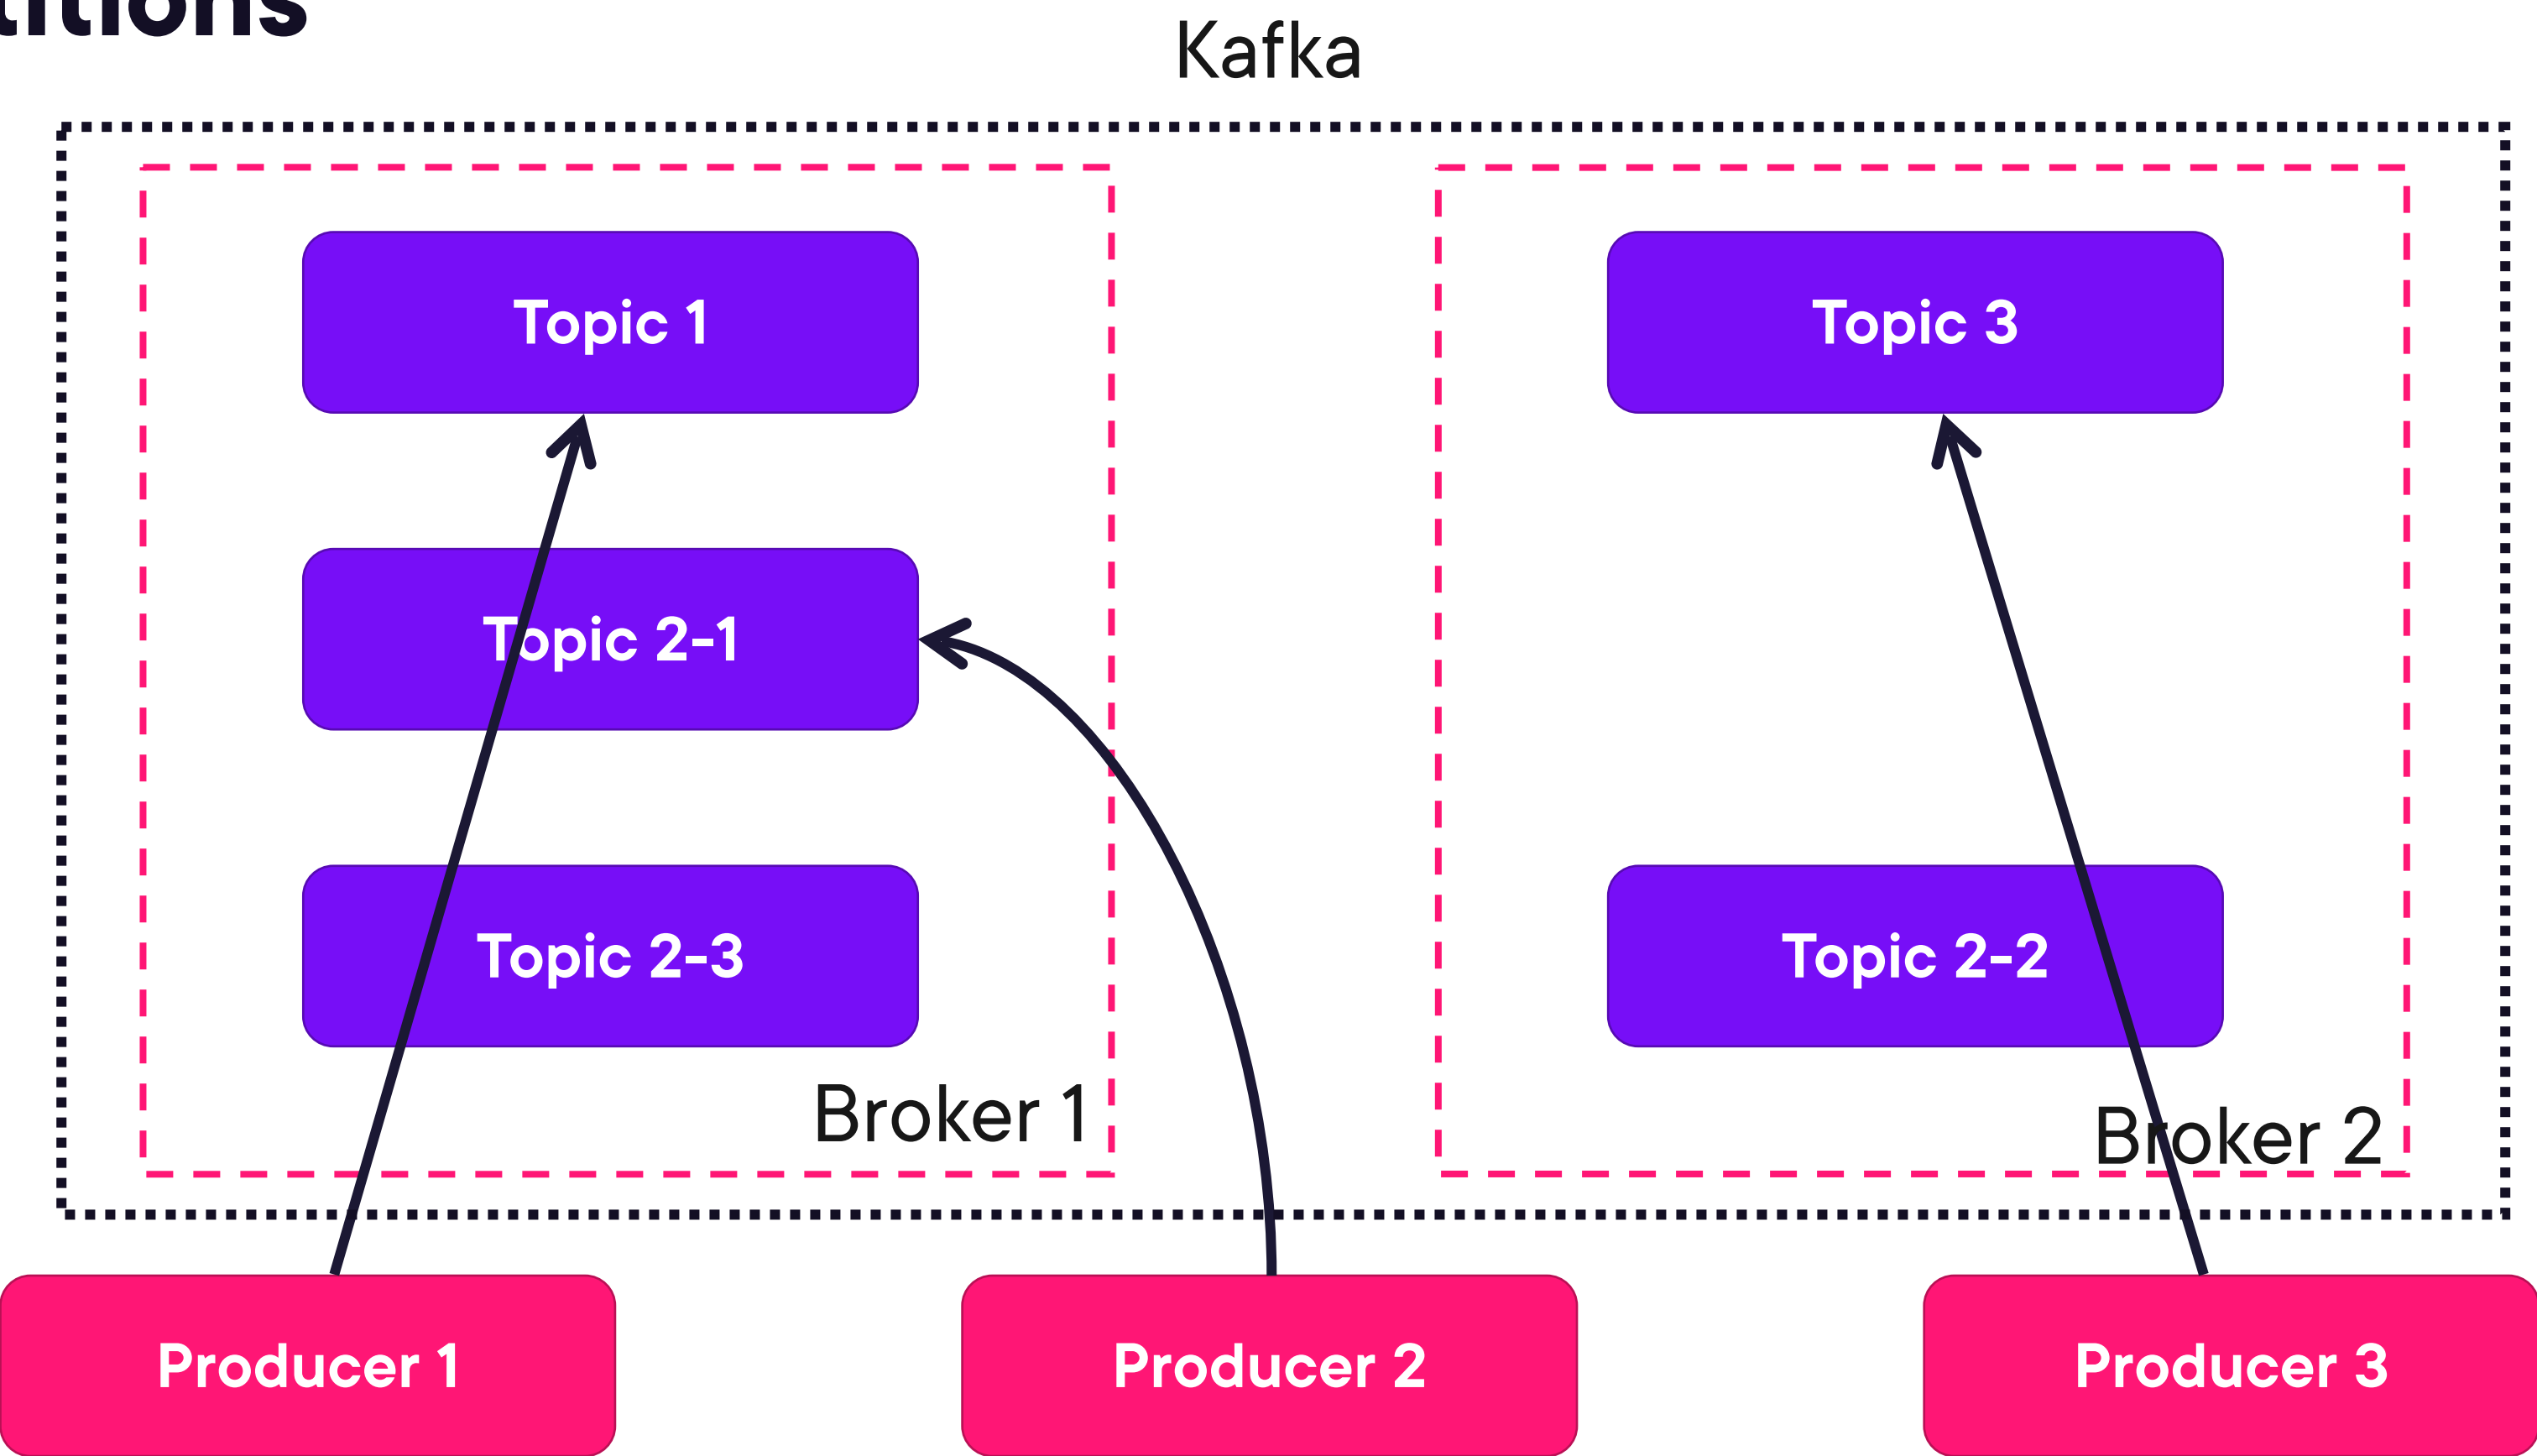

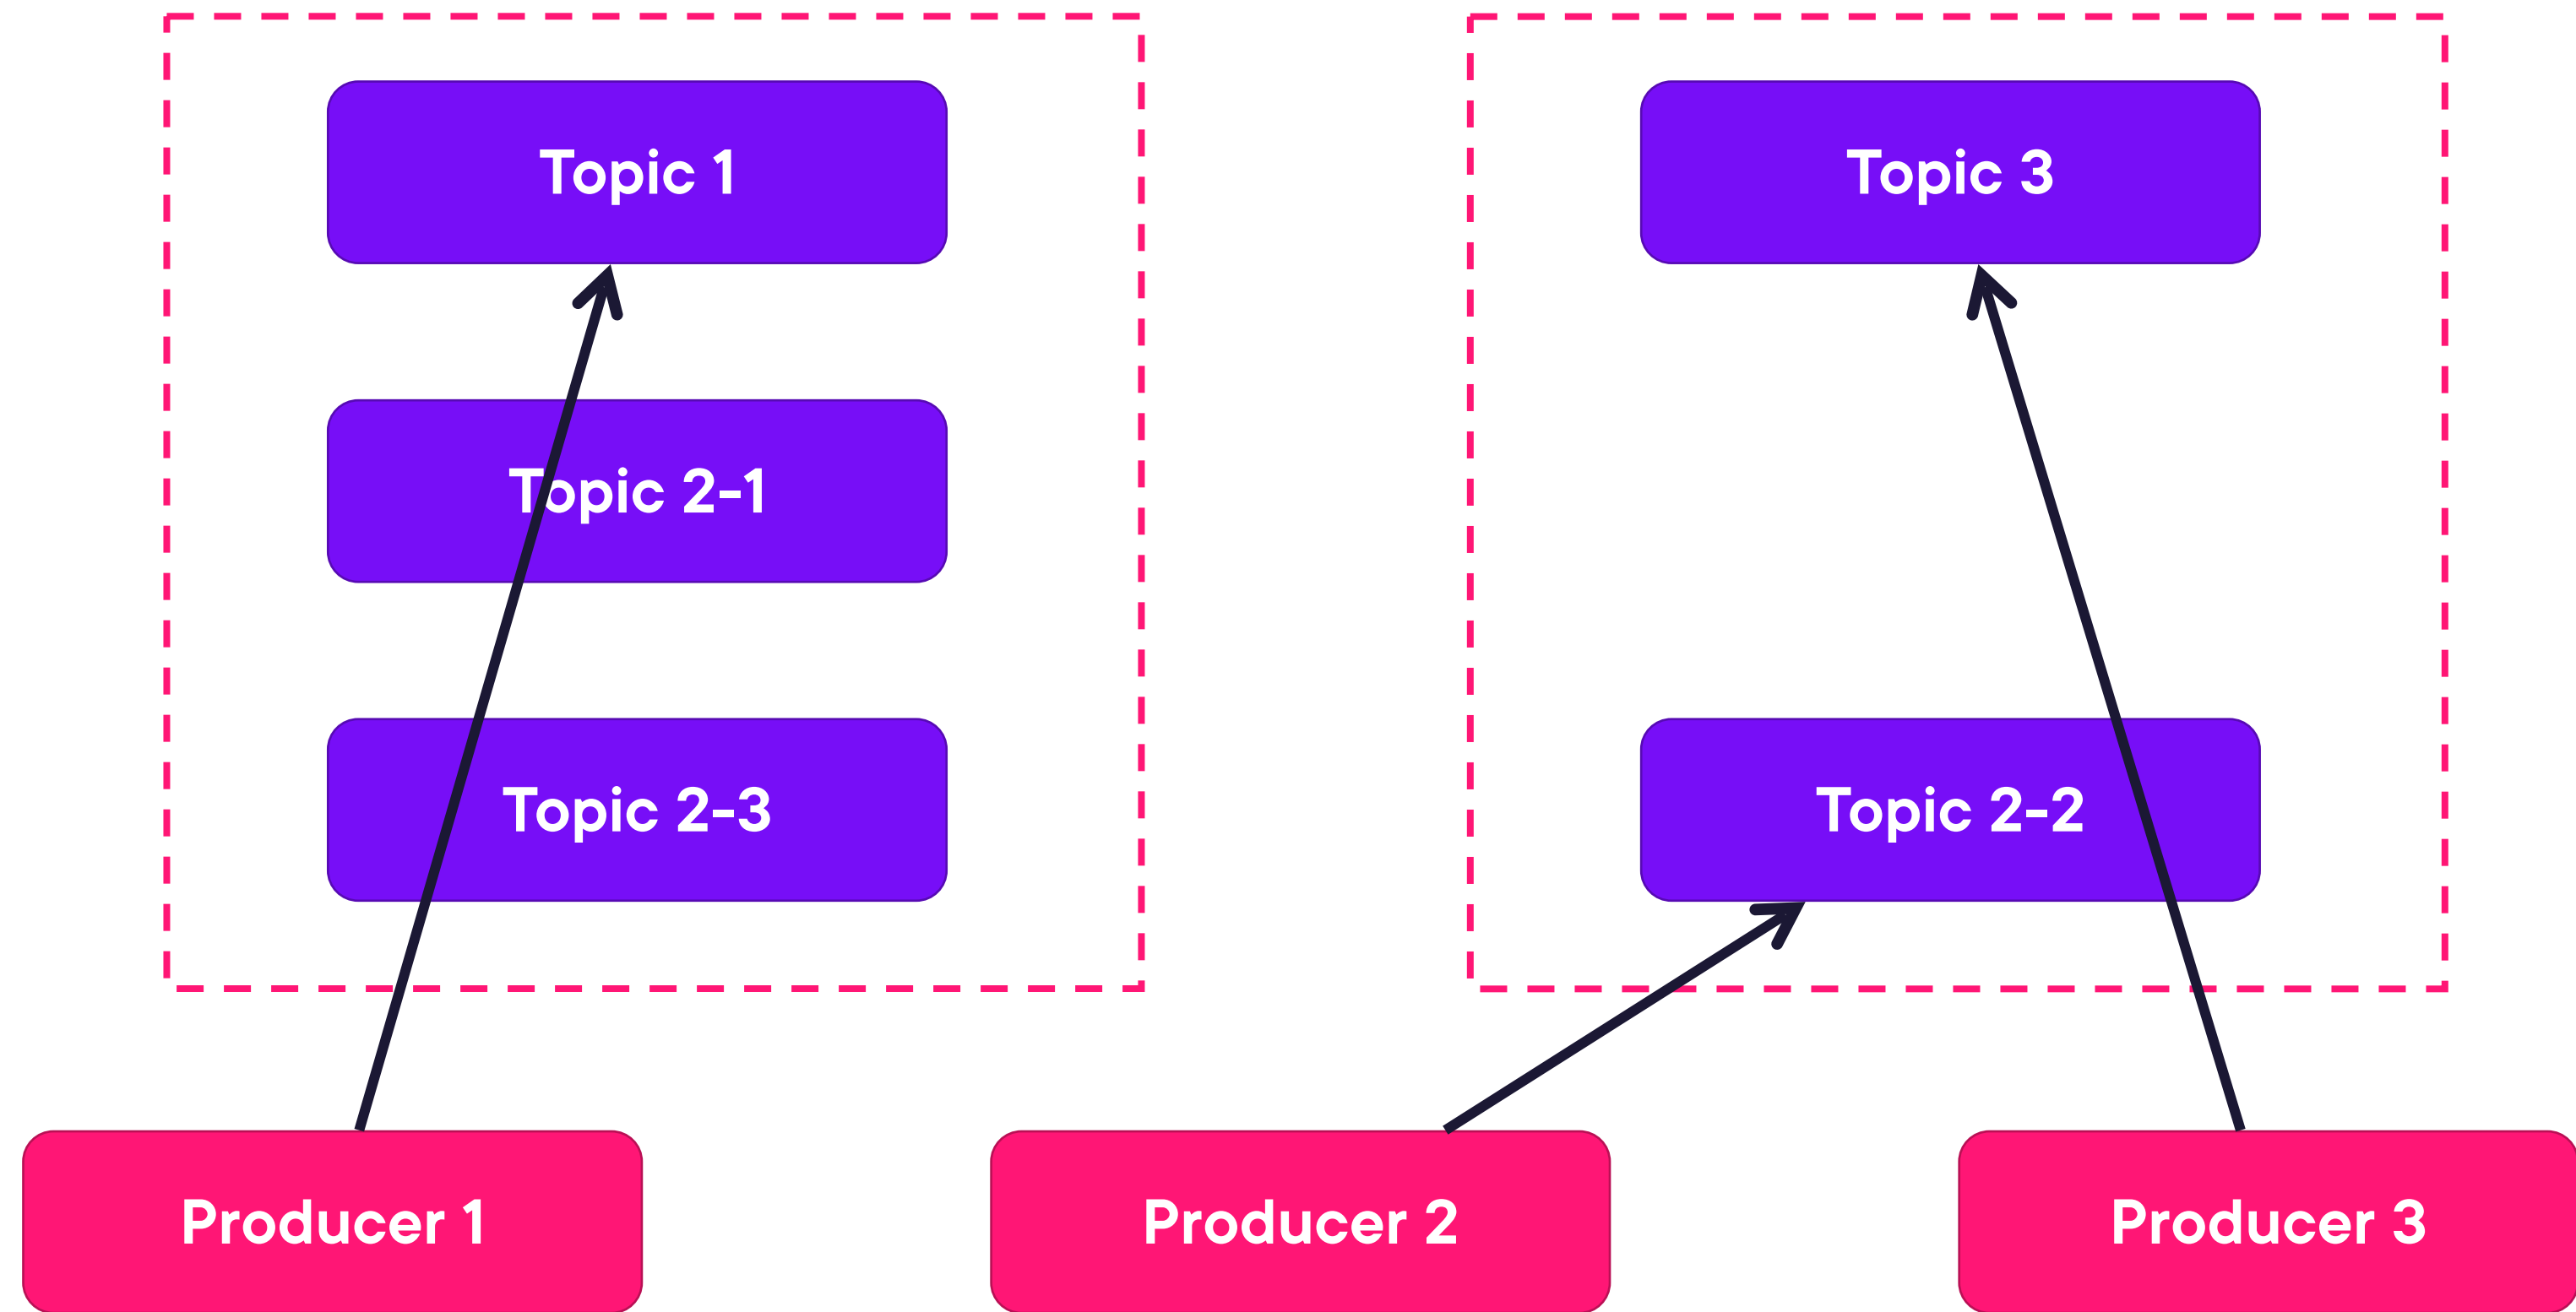

**The partitioner uses the key
to distribute the messages
to the correct partition**

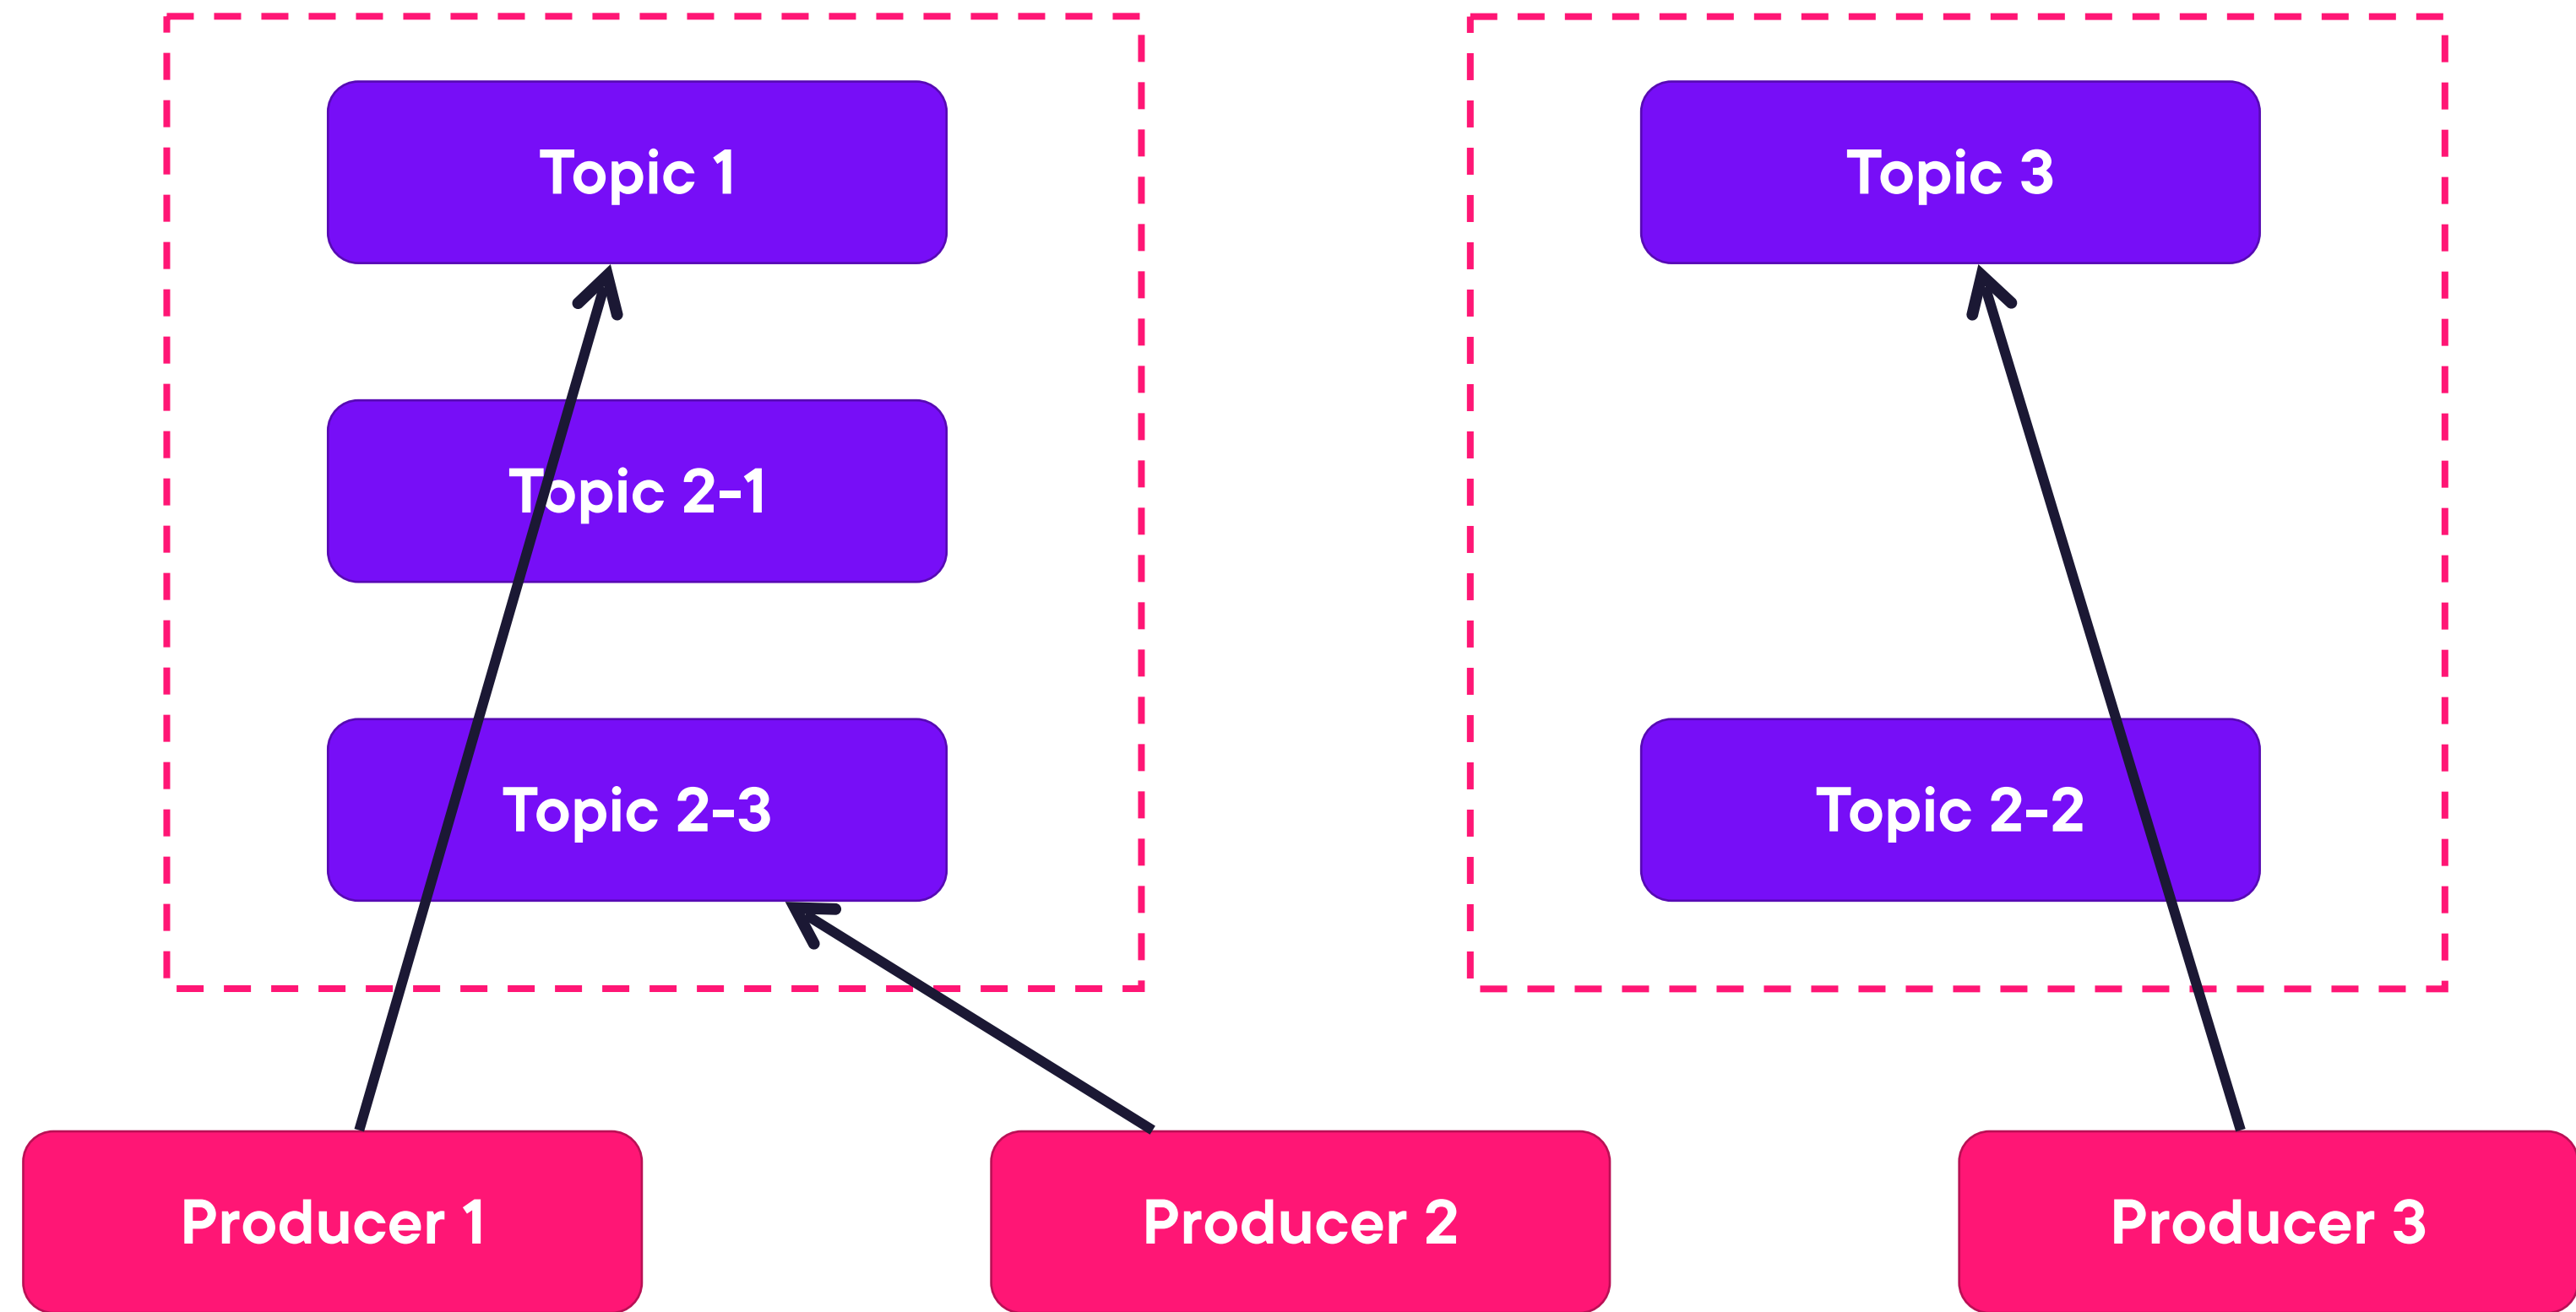

Partitions

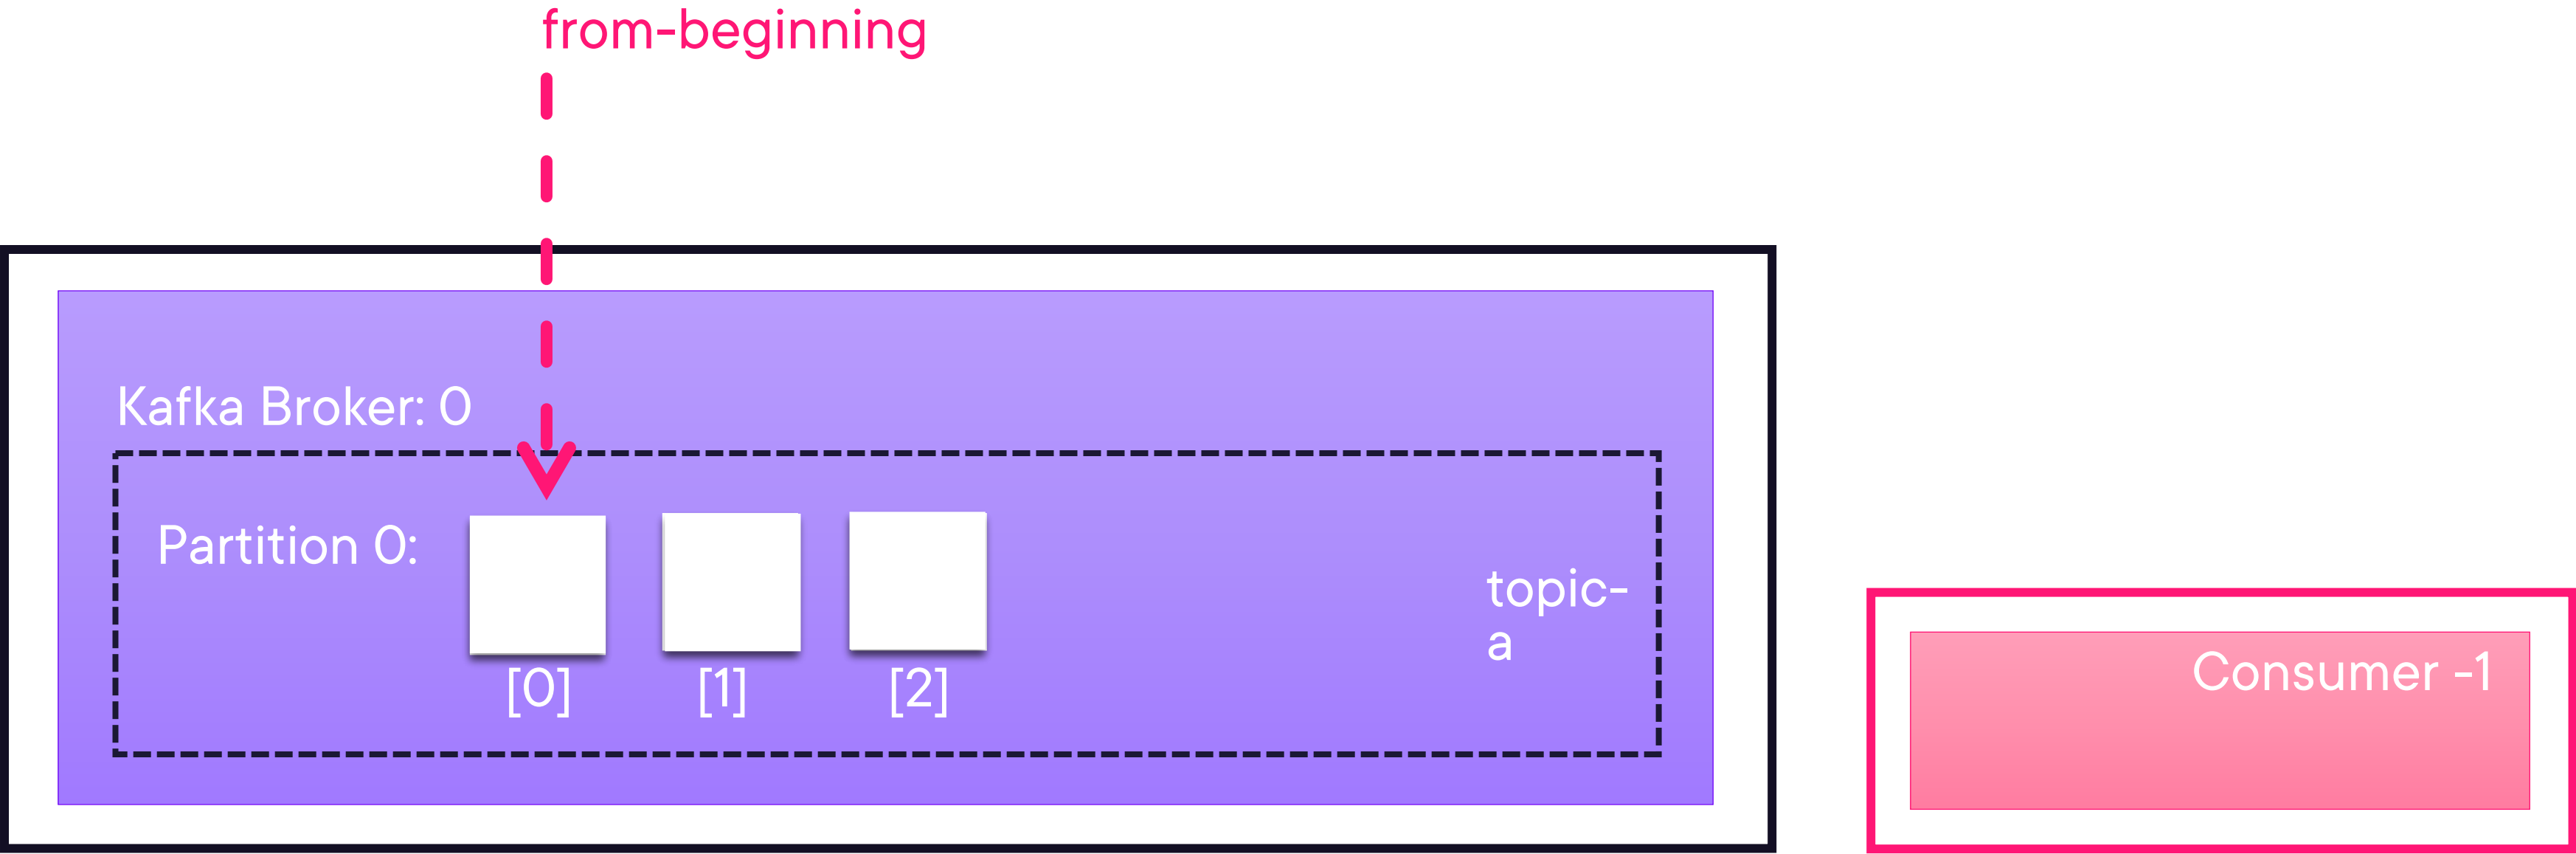

Partitions

Partitions

Consumer Offset: From Beginning

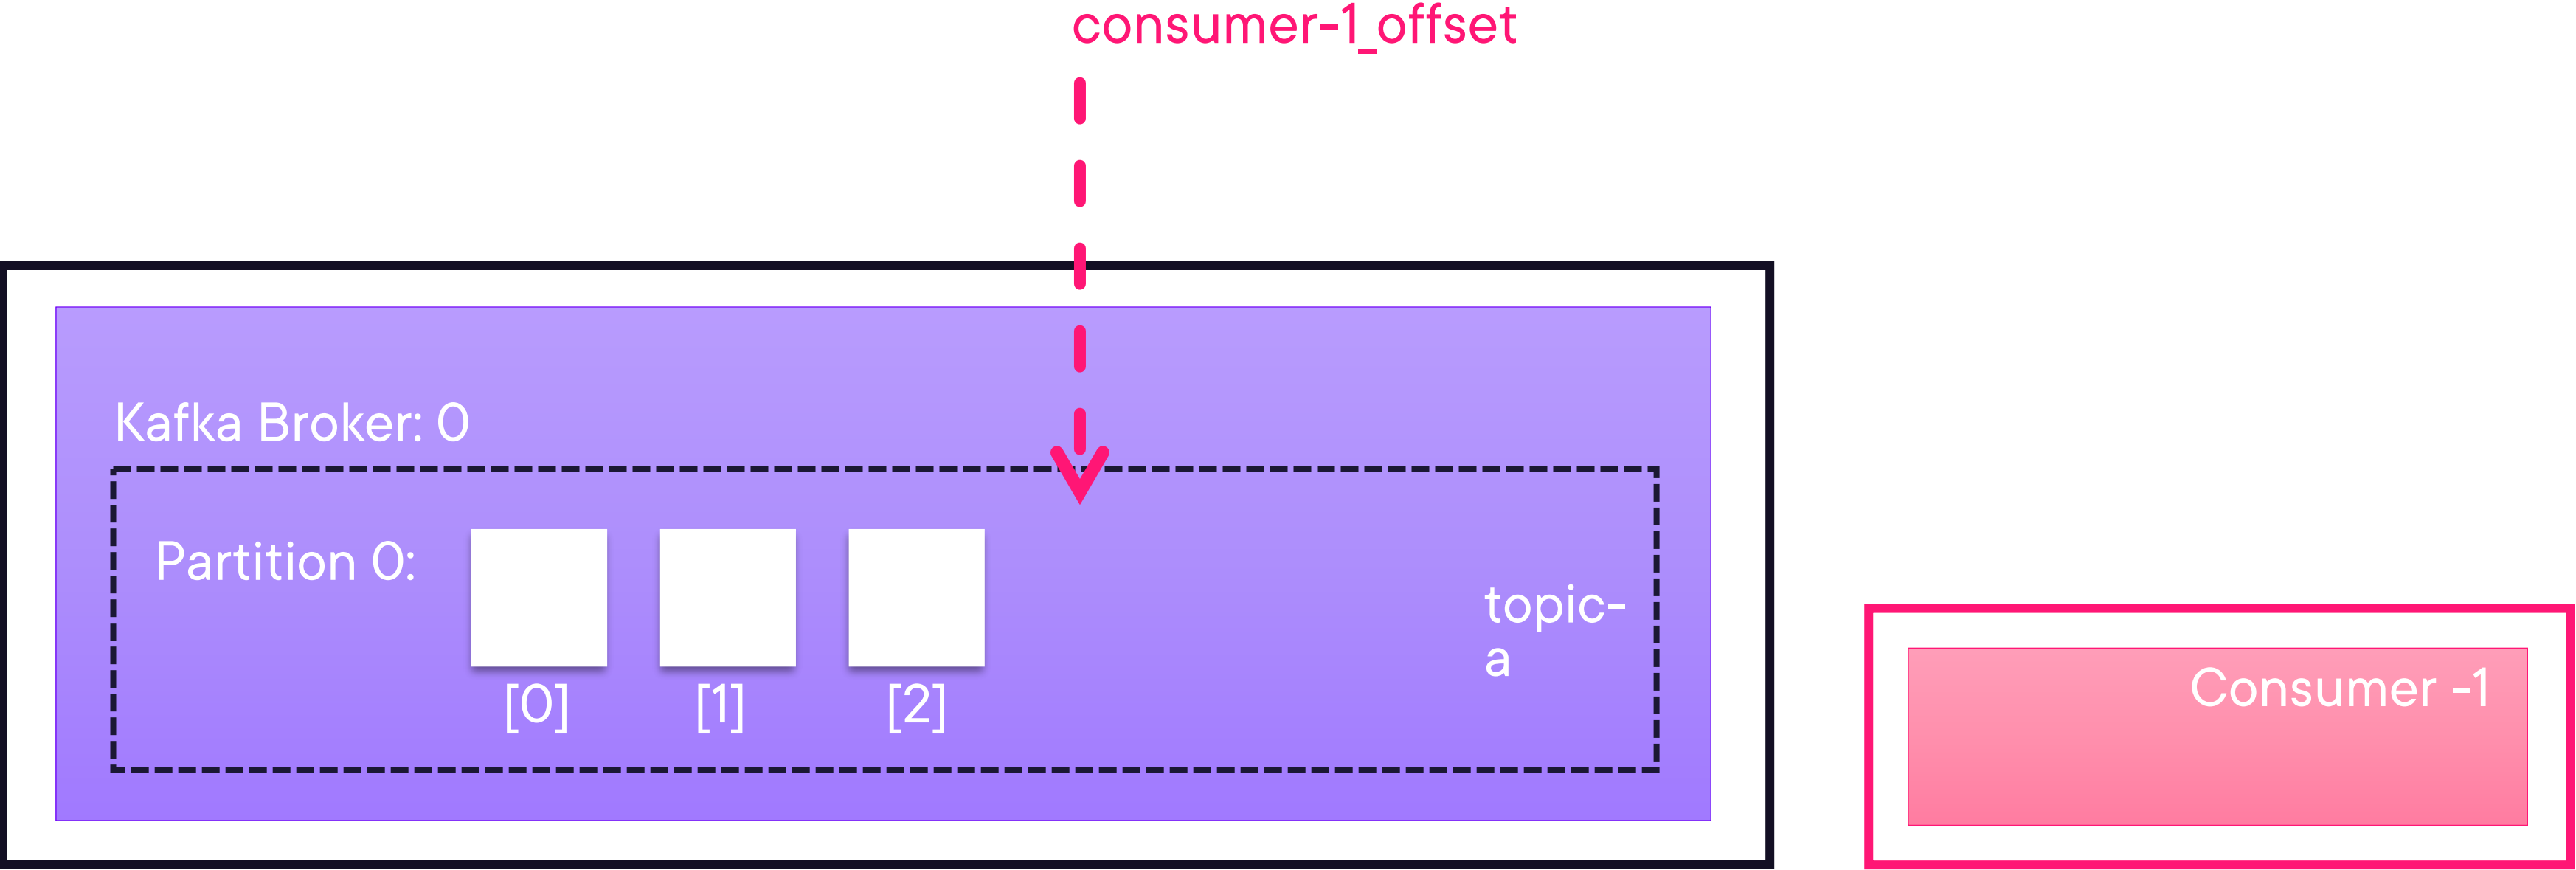

Consumer Offset: From End

Consumer Offset: Already Have Been Here

Consumer Offset

We Learned

Topics can be partitioned

The partitioner uses the message key to redirect messages to partitions

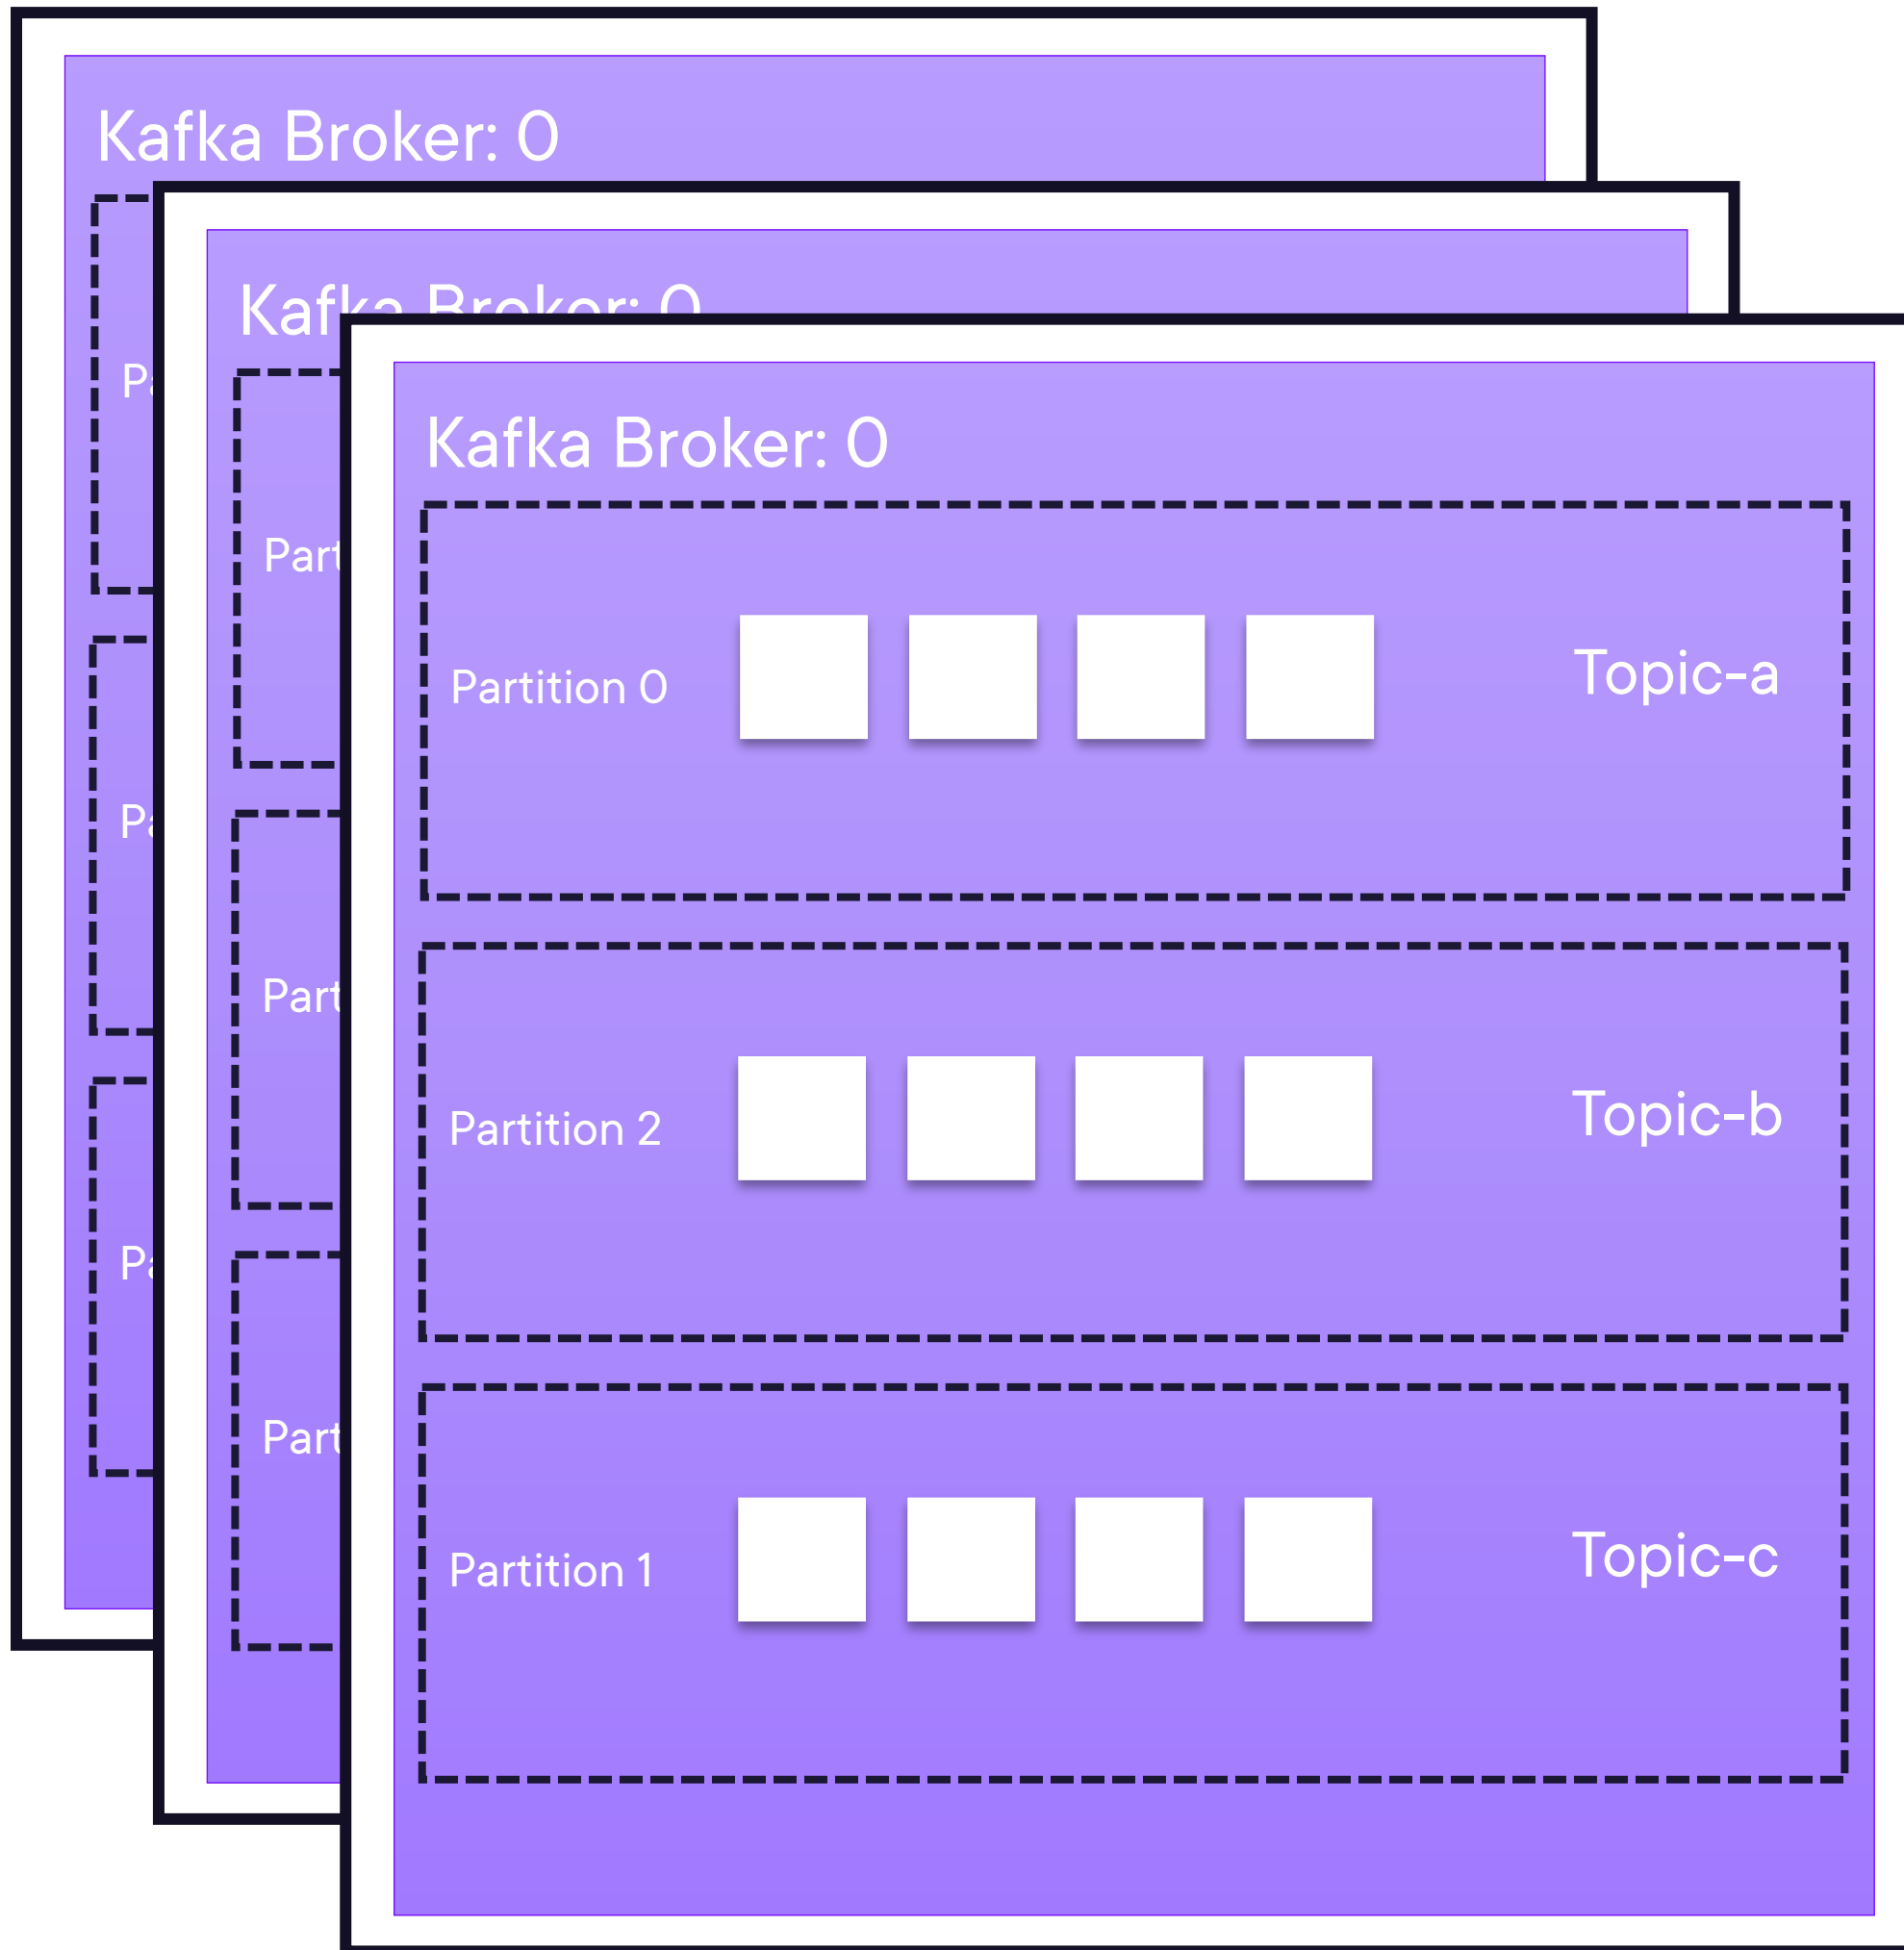

Consumers read from partitions and have an offset

Therefore, more partitions enable more consumers, therefore more scalability

Each partition is on a different broker, therefore a single topic is scaled

Interacting with Kafka via REST Proxy
